

Gemma arena deep dive: circuit-tracer's pruned circuits vs our learned circuits, on their shipped scan (6 seeds, 48 windows each)

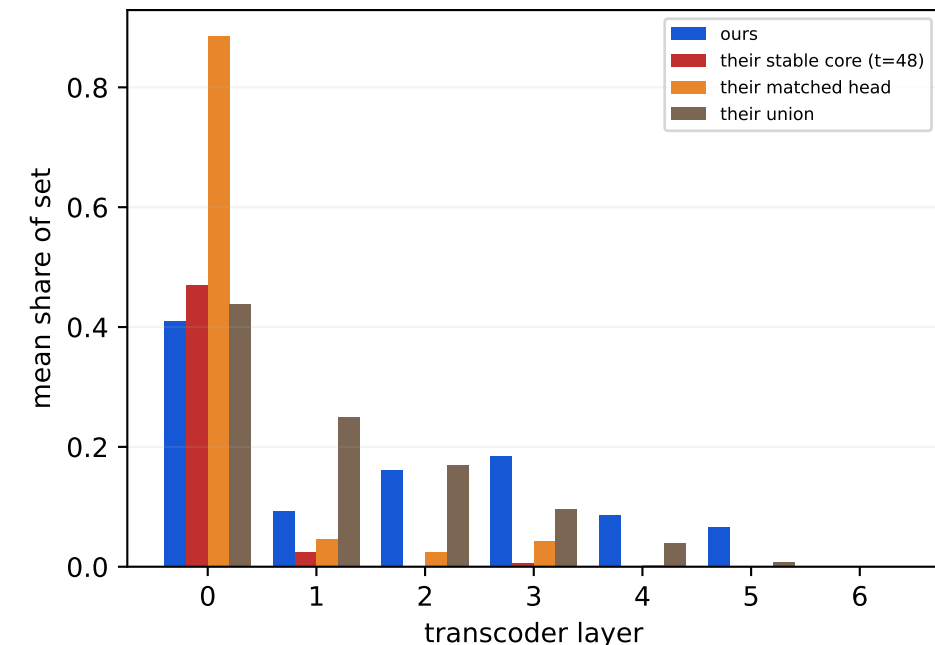

A. How deep must each ordering go to recover our circuit?

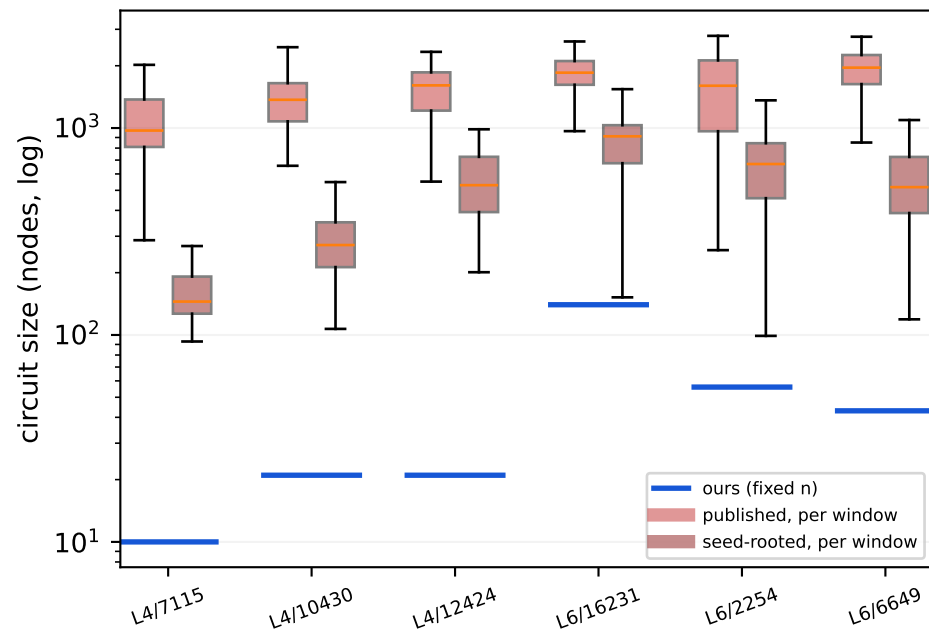

B. Membership churn across windows: the pruned circuit is mostly window-local

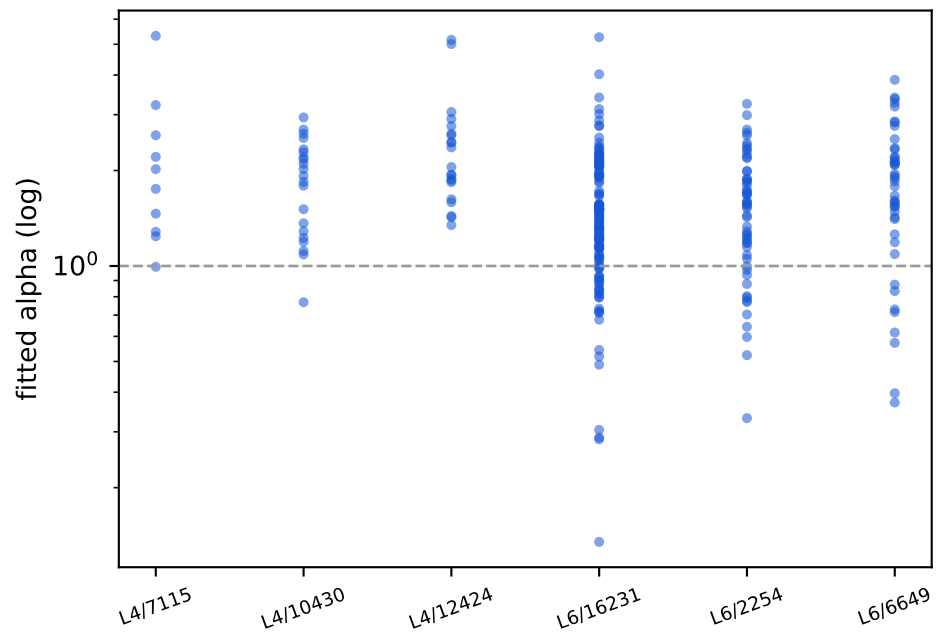

C. Where the nodes live: layer composition (mean over 6 seeds)

D. Natural sizes: their pruning per window vs our learned circuit

E. Calibration is not uniform: fitted amplitudes span an order of magnitude

F. Consensus frontier: their circuits cut by their own window-survival signal
